

Fresh Evaluation Pipeline - Run Summary

CLI Arguments:

Real data: data/sp500_data.csv

Models: llm

Windows: PreCOVID:2017-01-01,2019-12-31

Sequence length: 60

Output directory: results/llm_test

Annualisation: none

Force inverse scaling: True

Sanity bounds: std $\in$ [0.005,0.05], $|r|\leq 0.5$

Allow sanity bypass: True

Processing Summary:

Real data: 3772 observations, mean=0.000497, std=0.010857

Loaded models: llm

Processed windows: PreCOVID

Sanity Gate Results:

△ PreCOVID: {'Real': 'OK', 'llm': 'SUSPECT SCALE (std=0.077894, max|r|=0.450)'}
The 'llm' model for the PreCOVID window has triggered a 'SUSPECT SCALE' warning. This indicates that the model's performance metrics (std=0.077894, max|r|=0.450) are outside the predefined sanity bounds (std ∈ [0.005, 0.05], |r| ≤ 0.5).
